Model-based diagnosis framework with web application

Software development project

July 13, 2020

Supervisor
Alex Mitrevski

Project Members

Amine

Anna Rose Johny

Chandrika

Motivation

- Analyzing robot operation to determine the fault and repair.
- Present work - Launch files, display the published messages in web page for analyzing robot faults.
- Problem - Lack of online tools available for analyzing robot operation for diagnosis and fault detection.

Problem Analysis

- Model-based diagnosis system can be used for long term monitor and diagnose ROS based systems.
- Various diagnosis values stored in database for online fault diagnosis.
- Messages published are diagnosis message and observation message.
- Contents - stamp, sequence number, frame id, observation, observation message, verbose observation message.

Solution approach

- Multiple ROS nodes are launched using "roslaunch" command.
- Launched diagnosis values are stored in database created using SQLite3.
- Displaying the diagnosis values(diagnosis and observation messages) using Flask framework in webpage for fault analysis.

Softwares used

ROS

Framework for writing
robot software

Technical Details

Webpage

The screenshot shows a web browser window with the title "Robot Diagnosis". The address bar shows the URL "127.0.0.1:5000". The browser has two tabs, with "Robot Diagnosis" being the active one. Below the browser window, there is a navigation bar with three items: "Diagnosis", "Home", and "Robot Diagnosis". The "Diagnosis" item is highlighted in blue. The main content area displays two diagnostic messages. The first message has a "Stamp" of 1592779758913727058, "Sequence num" of 809, and "Frame ID" of . It is of type "hadag-ci-picosat". The "Message" field is "Empty", and the "Header" is "/robot_41/corrected_odometry_pose/robot_41/odom". The "Resources" field contains a JSON object: {"stamp": {"secs": 0, "nsecs": 0}, "frame_id": "", "seq": 0}. The "observation" field contains the text: "For the input pair with the name '/robot_41/corrected_odometry_pose/robot_41/odom' no state could be estimated". The "Observation Message" is -2, and the "Verbose observation Message" is "no state". The second message has a "Stamp" of 1592779758913841104, "Sequence num" of 808, and "Frame ID" of . It is also of type "hadag-ci-picosat". The "Message" field is "Empty", and the "Header" is "/robot_41/focalization_score". The "Resources" field contains the same JSON object as the first message. The "observation" field contains the text: "For the topic with the name '/robot_41/focalization_score' no state could be estimated". The "Observation Message" is -2, and the "Verbose observation Message" is "no state _robot_41/focalization_score".

Diagnosis

Stamp: 1592779758913727058 Sequence num: 809 Frame ID:

Type: hadag-ci-picosat

Message: Empty Header: /robot_41/corrected_odometry_pose/robot_41/odom

Resources: {"stamp": {"secs": 0, "nsecs": 0}, "frame_id": "", "seq": 0}

observation: For the input pair with the name '/robot_41/corrected_odometry_pose/robot_41/odom' no state could be estimated

Observation Message: -2 Verbose observation Message: no state

Stamp: 1592779758913841104 Sequence num: 808 Frame ID:

Type: hadag-ci-picosat

Message: Empty Header: /robot_41/focalization_score

Resources: {"stamp": {"secs": 0, "nsecs": 0}, "frame_id": "", "seq": 0}

observation: For the topic with the name '/robot_41/focalization_score' no state could be estimated

Observation Message: -2

Verbose observation Message: no state _robot_41/focalization_score

Thank you
